1 Introduction

This document provides information about the second coursework for the Web Development module. Please remember this is a super module and that a different assignment is set (around the same theme) for the 3rd and 4th year student under the IN3050 and INM428 codes respectively.

In principle, this coursework forms an extension to the website you developed in the first coursework. However, there is no expectation that you will make any significant changes or improvements to that work. You need only add an appropriate link or links to that site to access the content created in this coursework.

1.1 Structure

The assessment has four submittable parts:

1. To develop a **dynamic web tool** that has good semantic structure and is well designed, also, it must be accessible and responsive. This tool will extend the Food Bank website (full details are provided in section 2) so that:
 - a. authorised staff member can record/manage;
 - i. opening hours and,
 - ii. required shifts for volunteers.
 - b. Volunteers can;
 - i. register with the Food Bank and,
 - ii. select shifts they are willing to cover.
2. Write a simple supporting **document to explain your design and implementation choices** for this tool. This explanation should be at most two sides of A4 and is intended to provide insight to your thought process during the design and development process. See section 3.2 for full details, this document must be in **Microsoft Word .docx format**.
3. A **video walkthrough** of the functionality the pages and features of your new tool to show how it meets the needs described and demonstrate the overall user experience. This should be at around 10 minutes long (note, you will find a separate [video submission area](#) for this deliverable on Moodle). Remember, the video *must* have an audio track of your narration of what is being demonstrated. See section 3.3 for full details.
4. A **clear statement about any reuse of code, content** or other assets as well as your **use of GenAI** (or statement that you did not use it). See section 3.4 for full details, this document must be in **Microsoft Word .docx format**.

Parts 1, 2 and 4 will be submitted to the [main submission area](#) as part of an archive, see section 4.1 for full details.

Note, failure to comply with the [archive structure](#) will result in a penalty being applied to your final mark for this coursework of 10%.

2 New Web Tool Requirements

2.1 Customer needs

The Community Table Food Bank need an extension to the website you have already designed for them. This needs to support staff in managing the food bank's opening hours as well as Volunteer shift required to cover the its operations. Community Table varies its opening times to meet the needs of community in Islington. At present, these changes are communicated by updating a sign in the window. They would like their website to display the opening times for both the current week and the following week. This data will be managed by a selected member of staff who should be able to log into the website and set the opening hours for upcoming weeks. It is critical that only authorised people can access this feature.

Community Table rely on volunteers to staff the food bank and also want to take advantage of their new website to enable volunteers to register on the site and sign up for shift. Like the open hours, the food bank want to be able to mange the shift details via the website and show a list of upcoming shifts to registered volunteers so they can sign up. Shift do not always match the food bank's opening hours, as volunteers are required before and after opening for additional duties. Anyone over 18 can register and the food bank needs to record each volunteer's name, email address, phone number and confirmation of their age.

Volunteers should be able to register themselves on the website and then be able to log in to see what upcoming shirts are available. Then they should be able to sign up for up to two shifts per day. For each day, the authorised staff member should be able to view a list of registered accounts and for a given day, who has signed up for each shifts. Two people are required for all shifts.

Community Table need the tool to be linked from their current website and fit in with the current look and feel. They also need it to work on both desktop computer and mobile phones. Information must only be available to the appropriately authorise people, but they do not want to have to keep logging in every time the return to the computer. They have determined that staff should be able to stay logged in for up to eight hours and volunteers for up to an hour. Both groups should have the choice to stay logged in or not (ie. for the site to remember their login or not).

Community Table have provided the following example of open hours and shifts for a week.

Day	Open	Close
Monday	10.00	19.00
Tuesday	10.00	19.00
Wednesday	11.00	15.00
Thursday	10.00	18.00
Friday	10.00	19.30
Saturday	09.00	19.30
Sunday	10.30	16.00

Table 1 Example opening hours for Community Table Food Bank

Day	Yellow Shift	Blue Shift	Orange Shift	Purple Shift
Monday	09.00 – 12.00	11.30 – 15.00	14.00 – 18.00	17.00 – 20.00
Tuesday	09.00 – 12.00	11.30 – 15.00	14.00 – 18.00	17.00 – 20.00
Wednesday	10.00 – 13.00	12.00 – 15.00	14.00 – 16.30	NONE
Thursday	09.00 – 12.00	11.30 – 14.30	14.00 – 17.00	16.30 – 19.00
Friday	09.00 – 12.00	11.30 – 15.00	14.00 – 18.00	17.00 – 20.00
Saturday	08.00 – 11.30	10.30 – 15.00	14.00 – 18.00	17.00 – 20.30
Sunday	10.00 – 13.00	12.00 – 15.00	14.00 – 16.30	NONE

Table 2 Example shift hours for Community Table Food Bank

2.2 Technical requirements

The site must be written in HTML 5, CSS 3 and PHP 8+ using a MySQL database. Further, the technical implementation must follow the MVC pattern (being built on the modules *php_mvc* package, see [Week 8 lecture resources](#) on Moodle) with asynchronous JavaScript used to update the page content where appropriate. Further, the use of TWIG for page templates is required.

The site must be accessible, responsive (phone and desktop versions are required) and 'safe' including appropriate verification and validation of input.

PHP Composer must be used to manage all PHP dependencies (this is in place for TWIG within the *php_mvc* package already). Further, all submissions will be tested using the module's recommended Docker setup and you must ensure you take into account the instillation process that will be used to test your site, as detailed in section 4.1.1.

This web application must visually fit with your previous submission (you may update this if you wish based on the feedback). Further the use of CSS libraries/packages is permitted for this assignment. In addition, the use of Font Awesome is encouraged as appropriate. Note, these must be detailed in your submission, see section 3.4.

2.3 Emails

Due to the limitation of the Docker setup, emails cannot be sent. If you make use of email functions, you should construct the email content and render this as text. This text can either be shown on the page or be accessed via a link presented at the appropriate point in the process.

2.4 Database

Your web tool will need to make use of a MySQL database. To ensure this will work when in the test environment, your website must use a database called 'foodbank' and access this using the standard 'webdev' user with password 'W3bD£velopment'.

Further, your website should reference a 'config.ini' file in the following location on the server '/var/www/private/config.ini'. This file will contain the database connection details (as demonstrated in week 7) as shown in Figure 1.

```
[database]
servername = database
username = webdev
password = W3bD£velopment
dbname = foodbank
```

Figure 1 config.ini file content for coursework test environment

3 Deliverables

3.1 Website

Your website needs to be submitted as part of the .zip archive.

Only the parts of the 'overall site' related to this web tool need to be submitted. You should include the index page of your previous submission to show how the tool is integrated into the wider site but no other parts are required or will be marked (inclusion will not cause a penalty).

Your website can make use of external content like fonts and icons (font awesome) etc. however, it must run as provided in your submission. All external content should be linked where required. Website will be tested while connected to the WWW but no login or other processes are permitted to access external content.

Please see the details on [archive structure](#) and the [installation process](#) to ensure your site is correctly structured.

3.2 Supporting Explanation

This short document is intended to help clarify your approach and implementation decisions. Further, it provides a resource so your thought process can be taken into account during the marking. There are many different ways to approach this task and many will be valid. The key for the assessment is not only explain the final product, but also the process used to get there.

You should provide up to two sides of A4 that explains your decisions and choices, e.g. why did you structure your HTML the way you did, why did you choose a particular element type, why did you setup a particular structure and routes or use a specific approach to verification etc. Also, you should briefly explain your security decisions and how you have accounted for the different viewing format (responsiveness) and ensuring accessibility.

There is no mark for this element, but failing to provide it may reduce your overall mark if your decision making is not clear in your design. Further, you will not be penalised if you exceed the specified length, provided this is reasonable. This document must be in **Microsoft Word .docx format**.

3.3 Video walkthrough

You are required to submit a short (10 minute maximum) video walkthrough of your completed web application. You should demonstrate the UX of your new web tool and show how it meets all the requirements explained in section 2.1. Further, you need to show the overall user journey and any verification and validation steps (please note the details in about emails in section 2.3 and show this appropriately). The technical aspects of the requirement in section 2.2 will be assessed separately.

There is no direct mark for this element, but **failing to provide a video will result in a mark of zero for the whole assignment**.

3.4 Reuse and GenAI statement

In addition to your explanation, you **must** provide a statement of reuse and use of GenAI. This must detail any code or other assets (save those provided to you by us as part of this coursework and coursework one) that you have used and a clear statement of your use (or not) of GenAI in line with the section below. This document must be in **Microsoft Word .docx format**.

Failure to provide this information will result in your work being considered as 'whole original', thus any reuse of resources or use of GenAI found will be considered under the plagiarism regulations.

4 What to submit

There are two submissions required for this assessment:

1. .zip archive
2. Video

Note, failure to comply with the [archive structure](#) will result in a 10% penalty applied to your final coursework mark.

4.1 Archive structure

Your work (web application and supporting documents) should be submitted as a single **.zip** archive. This archive must contain at the **root level a folder** titled '**website**' inside which all your website code must be provided. The main page of your website must be directly in the 'website' folder and named '**index.php**'. Your website must include references to all assets required to run and view the site. See the following section on how your website will be installed prior to testing.

In the **root** of the archive, should be the two documents; one being the explanation about your process (see section 3.2) and the second your statement about reuse of work and use of GenAI (see section 3.4).

In addition, the root must contain '`database.sql`' script to create the tables and added any data etc. required by your website. This script must add the content to a database called 'foodbank' which will be present in the test environment.

The overall structure of your archive is shown in Figure 2.

Figure 2 Required submission archive directory structure

4.1.1 Installation process

Your submission will be tested on the module's standard Docker set. The following process will be used to install your website/web tool.

1. Archive downloaded from Moodle
2. Archive will be extracted into a dedicated directory
3. The `database.sql` script will be executed
4. PHP Composer `install` command will be run within your website directory
5. The `index.php` page of your website directory will be accessed via a web browser.

4.2 Video

A single video file, maximum ten minutes in length with video and audio. There is no expectation for editing or other postproduction, this video is to show your working website and how it meets the customer's needs.

There is no direct mark for this element, but failing to provide a video will result in a mark of zero for the whole assignment.

5 Assessment Criteria

This deliverable contributes 80% of the module mark.

This assessment is separate into five key areas and will be assessed at the level appropriate to your level of study (total marks available is 100):

- | | |
|--|-------------------|
| 1. Meeting customer needs | (15 marks) |
| 2. Use of MVC¹ design pattern, setup and structure | (30 marks) |
| a. Appropriate use and structure of <i>php_mvc</i> package | (20 marks) |
| b. Constructions of TWIG templates | (10 marks) |
| 3. Technical implementation | (30 marks) |
| a. Style, use and structure of PHP | (10 marks) |
| b. Use of Asynchronous JavaScript | (10 marks) |
| c. Use of Database (including transactions where required) | (5 marks) |
| d. Site structure | (5 marks) |
| 4. Security | (15 marks) |
| a. Input verification and validation | (5 marks) |
| b. Script protection | (5 marks) |
| c. Site configuration, error messages etc. | (5 marks) |
| 5. Overall design including consideration of UX and UI | (10 marks) |
| a. Semantic structure and format of HTML | (3 marks) |
| b. CSS styling and layout | (3 marks) |
| c. Overall UX and UI | (4 marks) |

¹ Failure to use and build upon the module's *php_mvc* package as the bases of your web tool will result in all marks for the section being forfeited

6 Online resources, GenAI and software reuse

Web development, like all of software development, can be a collaborative process and the use of standard libraries and reuse of previously produced code is commonplace in industry. That being said, it is critical to understand when this form of reuse is appropriate and how it should be documented.

Any code not written directly by the student, including third-party libraries used within the work, must be fully referenced. In addition, the licence under which the code is reused must be documented and a review must be provided to demonstrate the student's understanding of the code and its relevance to the project. A report of these legitimate reuse must accompany the submission is the root of the .zip archive, see section 3.4.

The use of GenAI, such as ChatGPT is permitted within the Web Development module. However, in addition to the requirements above, where GenAI is used, you are required to provide details of the tool used to generate the code along with the search terms/prompts used. Note, that you are responsible for ensuring any licenses used by the work generated are appropriate and documents. Moreover, you are responsible for ensuring that the generated content is not plagiaristic. You are responsible for plagiarism not the GenAI.

It is strongly recommended that before you use any GenAI tool that you take time to understand how it works and what its limitations and biases are. You may find these videos on [Generative AI - Video Discussions and Related Material](#) useful.

Further, please review the [University's statement on GenAI](#).

7 Originality of Work

Collaboration is encouraged in this module and you are welcome to discuss ideas and seek feedback from fellow students. However, each student is expected to **work independently on their own website and to tackle the problem in their own way**. Obviously, there may be some similarities between the websites from different students and the structure of the content. However, copying of (parts of) work of another student, of course, is not permitted, and will be treated as plagiarism of coursework! If copying is detected², the student(s) involved will be given **zero** marks for the affected deliverable.

The reuse of elements of the student's own first coursework is expected and does not require declaration.

² Checks will be made! For example, via automatic comparison of source code submissions, etc
